Q. Write a function to fix this non-numeric table

We can use the `gsub()` function.

Will add the rownames from the original wee table…

The percentage is 93.16

Q2: What proportion of structures in the PDB are protein?

The main repository of structural data is the PDB. Let's examine what it contains. At the time of writing, there are 183,201 protein structures In UniProt, there are 251600,768 protein sequences.

```
round(183201/251600768*100,2)
```

```
[1] 0.07
```

Q3: Type HIV in the PDB website search box on the home page and determine how many HIV-1 protease structures are in the current PDB?

7434

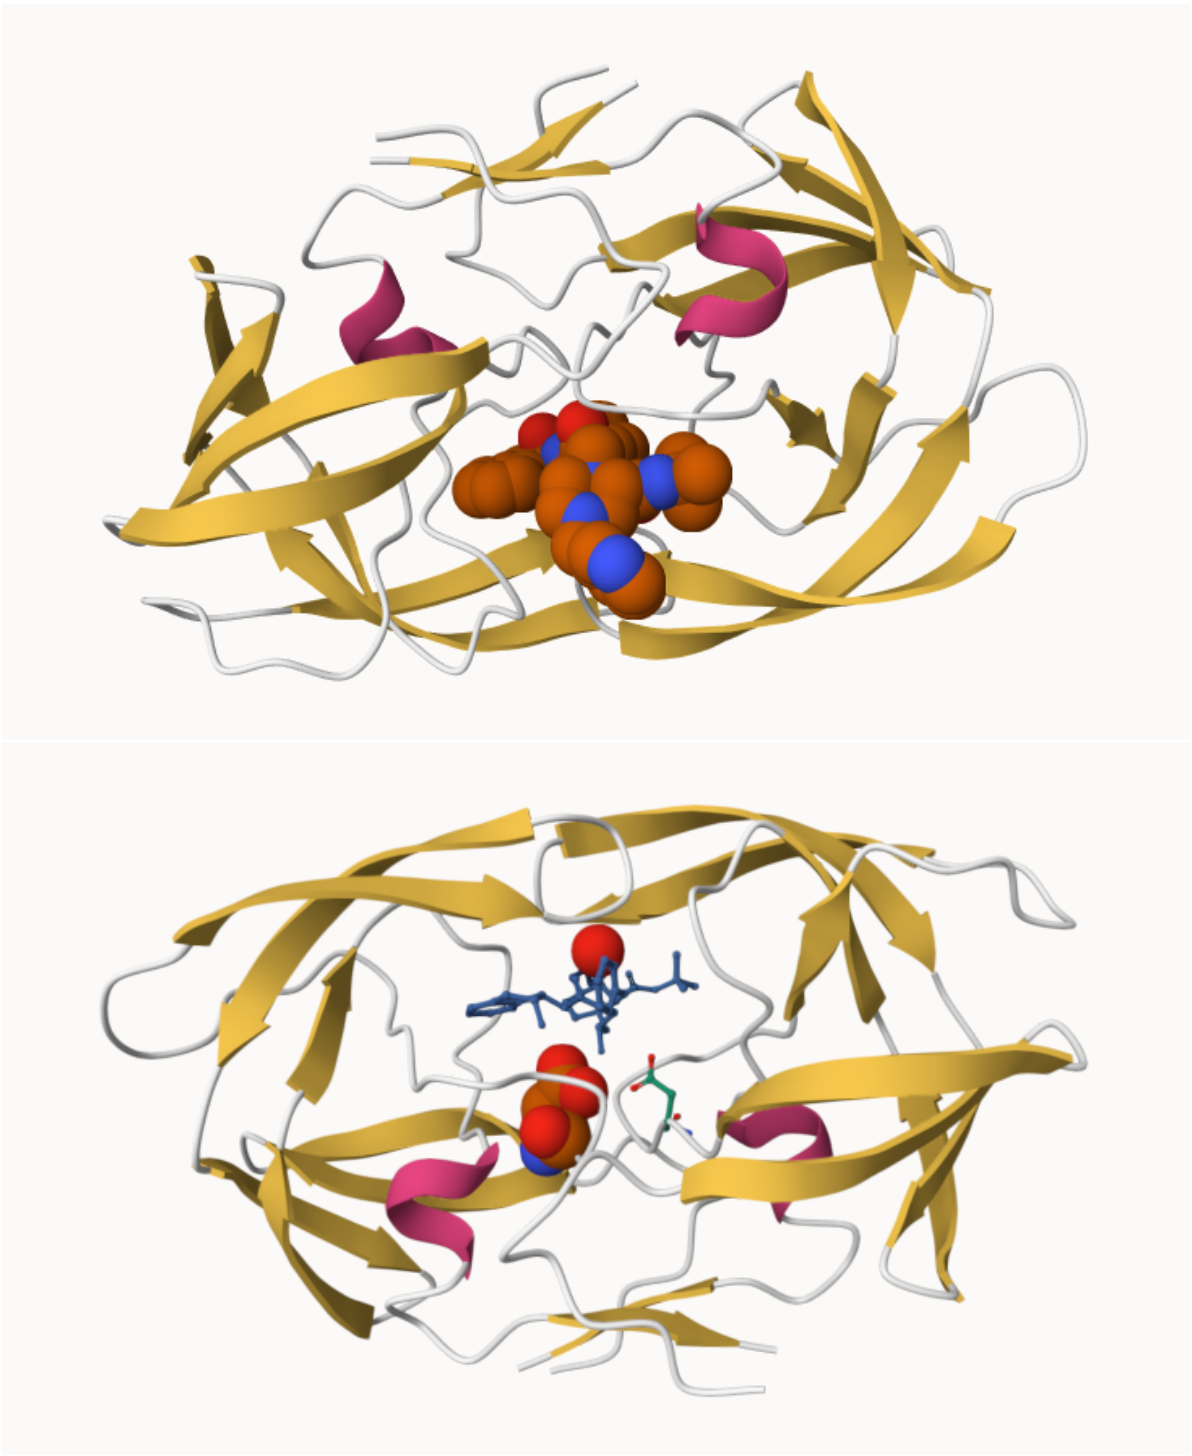
#2 Visualizing structure >Q4: Water molecules normally have 3 atoms. Why do we see just one atom per water molecule in this structure?

There are no hydrogen atoms observed in the structure. It's smaller than the 2A resolution.

Q5: There is a critical "conserved" water molecule in the binding site. Can you identify this water molecule? What residue number does this water molecule have

308

Q6: Generate and save a figure clearly showing the two distinct chains of HIV-protease along with the ligand. You might also consider showing the catalytic residues ASP 25 in each chain and the critical water (we recommend "Ball & Stick" for these side-chains). Add this figure to your Quarto document.



#Using the bio3d pakcage

```
library(bio3d)
```

```
Warning: package 'bio3d' was built under R version 4.3.2
```

```
pdb <- read.pdb("1hsg")
```

```
  Note: Accessing on-line PDB file
```

```
pdb
```

```
 Call:  read.pdb(file = "1hsg")
